WHICH HOT TUB IS BEST FOR YOU?

Here are some questions to ask yourself when choosing your new Hot tub:

- *How many people will use it?*
- *How often will the hot tub be used?*
- *How much space do you have?*
- *What are the measurements of fence gates or deck stairs for getting hot tub to final location?*
- *Based on the filled weight of the spa, will your deck or patio safely support?*

WHAT TO KNOW BEFORE INSTALLATION

Most hot tubs are meant to be installed ***outdoors***. If you wish to place a hot tub indoors, keep in mind that water is extremely heavy; a filled hot tub can weigh up to 3,000 pounds! Indoor hot tubs require solid foundation support and proper ventilation; steam can damage paint, wood, and more.

When installing your hot tub outdoors, it is critical that it sits on a level load-bearing, solid surface. Concrete decks or patios must be a four inch minimum depth. If placing your hot tub on a wood deck, be sure to consider the filled weight of the hot tub and the weight bearing capacity of your deck. The floor load of a filled hot tub with people is around 115# per sq ft. Your base should have at least 125# per sq ft load capacity. Make sure the hot tub is going to be positioned so that you have full access to the equipment compartments located by the hot tub controls. We suggest at least 30" around all sides and back panels for easy service access if ever needed.

MAKE WAY FOR DELIVERY

Hot tubs are large, awkward, and can weigh up to 700# unfilled! Make note of the measurements for the hot tub you ordered. You're going to need help getting the hot tub from the curb or driveway to your backyard. Make sure you have an unobstructed pathway and adequate gate openings to get your hot tub to the backyard. ***NOTE:*** all spa deliveries are curbside and delivery agent is not authorized to place in backyard, unwrap, or install. We suggest either renting a large furniture or spa dolly, or have 4-6 able-bodied friends available to place the hot tub in its final location.

Some things to remember after you have placed your hot tub order:

- *Hot tubs are ready to ship from the factory in approximately 2 weeks. You'll need to allow another 7-14 days for delivery to your home*
- *Delivery agent will contact you in advance to schedule a delivery date and time*
- *Have your equipment or helping hands available upon arrival of the hot tub if you want to immediately place in the backyard.* ***The delivery agent is only authorized to unload the item off the truck and place on the curb or driveway.***
- *Hot tubs are only shipped and delivered within the contiguous 48 states*

ELECTRICAL REQUIREMENTS

While several spas offered are conveniently wired for standard 120v electrical service, the larger hot tubs require a 240v electrical service, and must be permanently connected (hard wired) to the power supply. You will need to contract with a licensed, certified electrician to install a 240 volt 40 amp neutrally protected GFCI. A complete wiring diagram will be sent with the owner's manual. Supplying power to the hot tub which is not in accordance with manufacturer guidelines will void the manufacturer's warranty.
